Plataformes

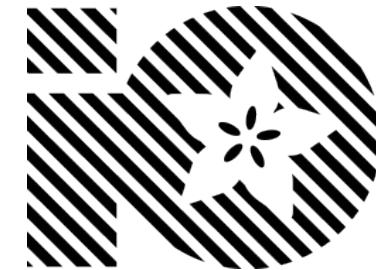

Google Cloud Platform

thethings.io

sentilo

thinger.io
platform

The logo for thinger.io platform features three blue 3D cubes stacked vertically, with the word "thinger.io" in a large, bold, black sans-serif font next to them, and "platform" in a smaller, grey sans-serif font below it.

myDevices

The logo for myDevices features a stylized icon composed of overlapping squares in orange, green, and blue, followed by the brand name "myDevices" in a lowercase, sans-serif font.

thingsboard.io

The logo for thingsboard.io features a small icon of a gear with a network of lines, followed by the brand name "thingsboard.io" in a lowercase, sans-serif font.

thingtia
CLOUD

Microsoft Azure

The Microsoft Azure logo consists of a blue triangle icon followed by the word "Microsoft Azure" in a blue sans-serif font.

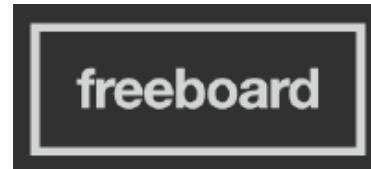

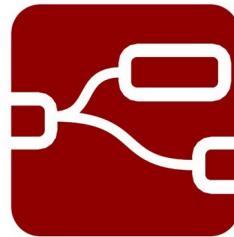

ThingSpeak

The logo for ThingSpeak features a white speech bubble icon with a blue outline, followed by the brand name "ThingSpeak" in a white sans-serif font on a dark blue background.

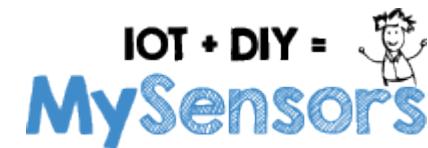

Viladecans

The logo for Viladecans features a red stylized 'i' or person icon followed by the word "Viladecans" in a red sans-serif font.

Raspberry Pi 3 IoT Home Server

Presentation

http://tinkerman.cat/rpi3_iot_server.pdf (Catalan)

Get the latest image and flash the SD card

- download the latest image

```
$ wget --output-document=raspbian.img.zip https://downloads.raspberrypi.org/raspbian_lite_latest
```

- locate the destination volume

```
$ unzip -p raspbian.img.zip | sudo dd of=/dev/mmcblk0 bs=4M conv=fsync
```

- mount the SD card
- windows users might want to install <http://www.paragon-drivers.com/extfs-windows/> to read/write EXT4 partitions
- locate the boot and rootfs partitions (on bare Windows machines only boot partition is visible)
- enable ssh by default:

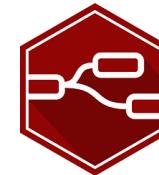

```
$ cd /media/$USER/boot  
$ touch ssh
```

- configure the wifi connection (optional):

```
$ cd /media/$USER/boot
```

Instruccions pas a pas:

CATALUNYA

Installation

In order to run the project there are a number of steps you have to do. These are quite general steps when working with `git` and `Docker`, and we will try to go thru them. But if you have no background on `git` or `Docker`, we recommend you to take a look at these tutorials.

<https://github.com/ttncat/ttncat-docker-compose>

```
$ git clone https://github.com/ttncat/ttncat-docker-compose.git  
$ cd ttncat-docker-compose/docker  
$ docker-compose up
```

Instal·lació amb Vagrant

<https://github.com/ttn-cat/ttncat-docker-compose>

This repository contains a docker-compose project based around Mosquitto, Node-RED, InfluxDB and Grafana. <http://ttn.cat>

Integració

Integracions des de TTN

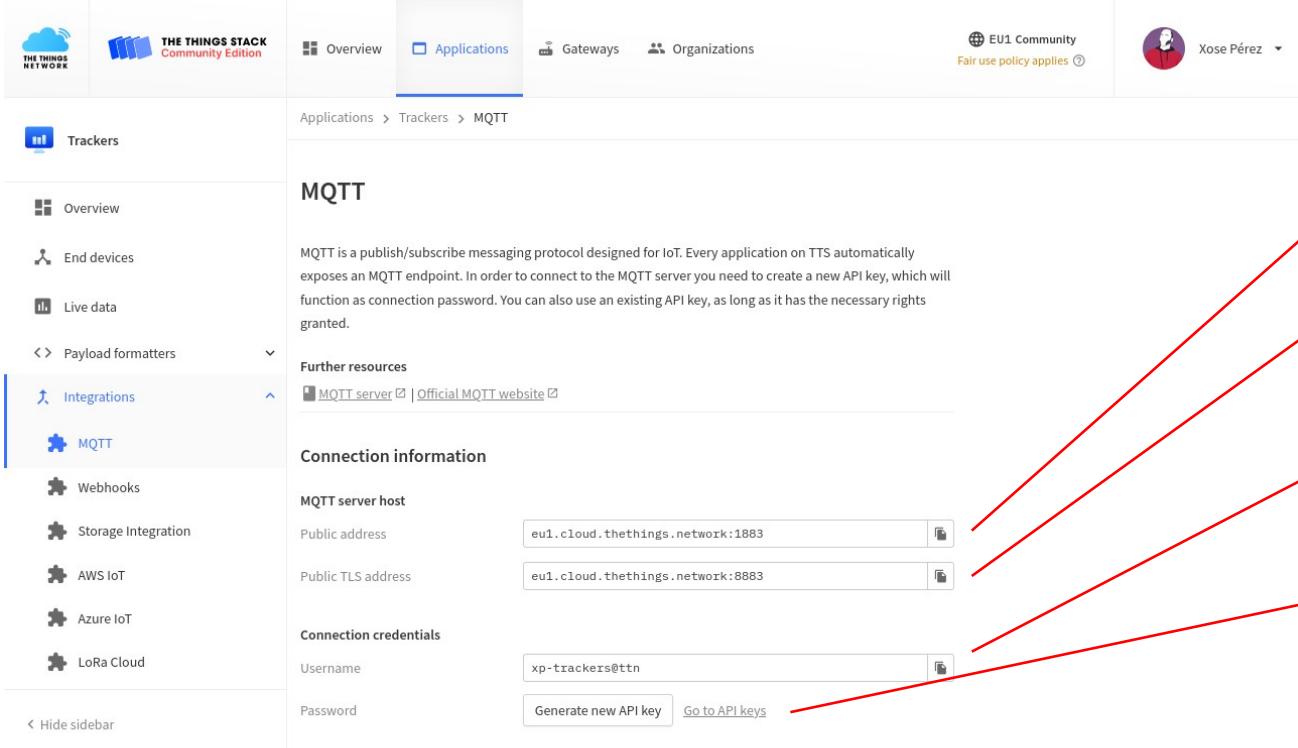

Per cada aplicatiu es poden definir 1 o més integracions:

- MQTT: publica missatges i events al broker local
- WebHooks: executa peticions HTTP(S)
- Storage Integration: habilita l'emmagatzemament temporal de dades (30 dies), consultable via API o gRPC
- AWS IoT: s'integra amb el packet IoT d'Amazon Web Services
- Azure IoT: s'integra amb el packet IoT de Microsoft Azure
- LoRa Cloud: envia les dades (i metadades) a LoRa Cloud de Semtech.

Enllaç MQTT

<https://www.thethingsindustries.com/docs/reference/root-certificates/>

The screenshot shows the 'MQTT' integration page in The Things Stack. The left sidebar has 'MQTT' selected. The main area shows 'Connection information' with fields for 'MQTT server host' (Public address: eu1.cloud.thethings.network:1883, Public TLS address: eu1.cloud.thethings.network:8883) and 'Connection credentials' (Username: xp-trackers@ttn, Password: [redacted]). A 'Further resources' section links to 'MQTT server' and 'Official MQTT website'.

Red arrows point from the following text labels to specific fields:

- Servidor MQTT no segur → Public address input field
- Servidor MQTT segur → Public TLS address input field
- Usuari → Username input field
- Mot d'accés → Password input field

Eines

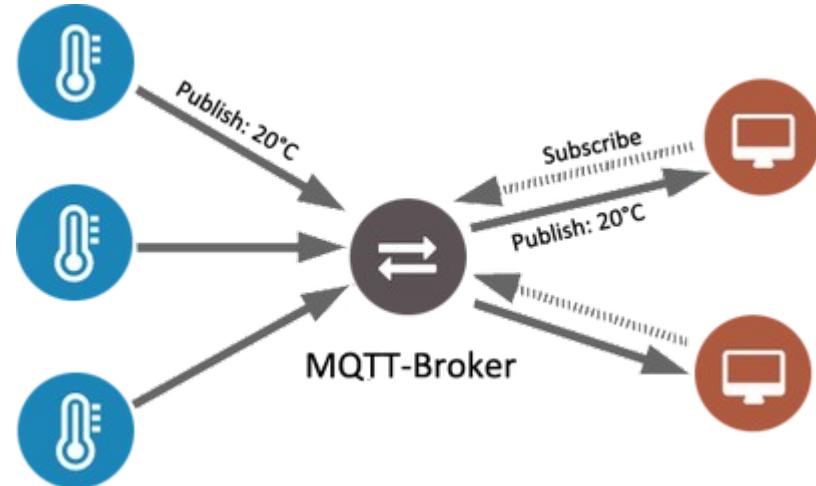

Mosquitto

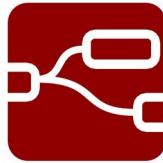

MQTT

- *Message Queueing Telemetry Transport*
- Protocol de missatgeria especialment dissenyat per telemetria (**sensors**)
- Patró **publish/subscribe**
- Quality of Service (**QoS**)
- Distribuït (*bridging*)
- Open Specification

Mosquitto

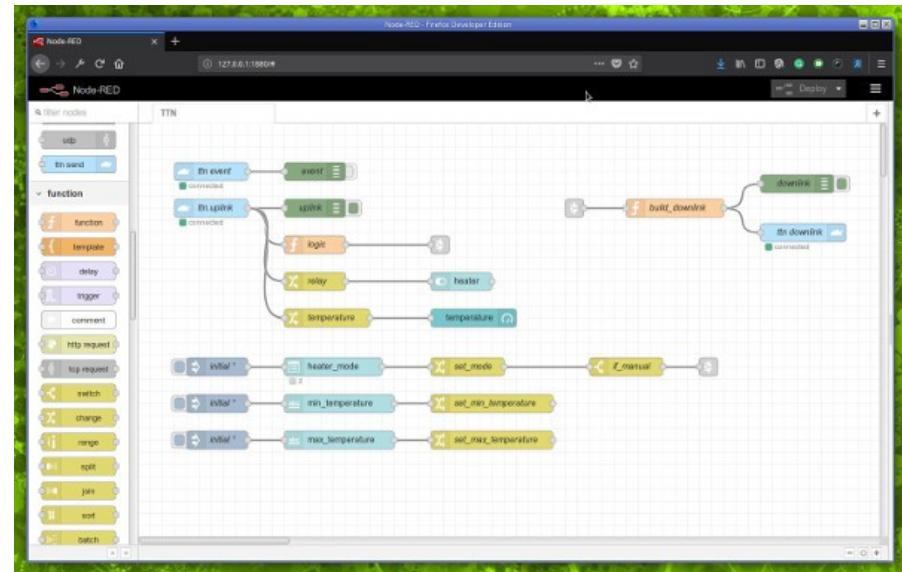

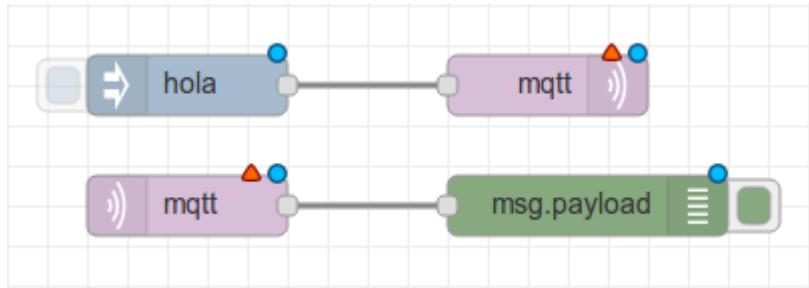

- Broker MQTT
- Open Source

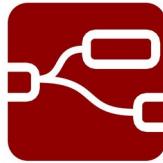

Node-RED

- Aplicatiu BI visual (drag & drop)
- Lògica basada en **nodes i fluxes**
- Basat en node.js (~javascript)
- Suport MQTT per defecte
- Open source
- Comunitat gran i activa
- **Aplicatiu web**

Node-RED

Cercador de nodes

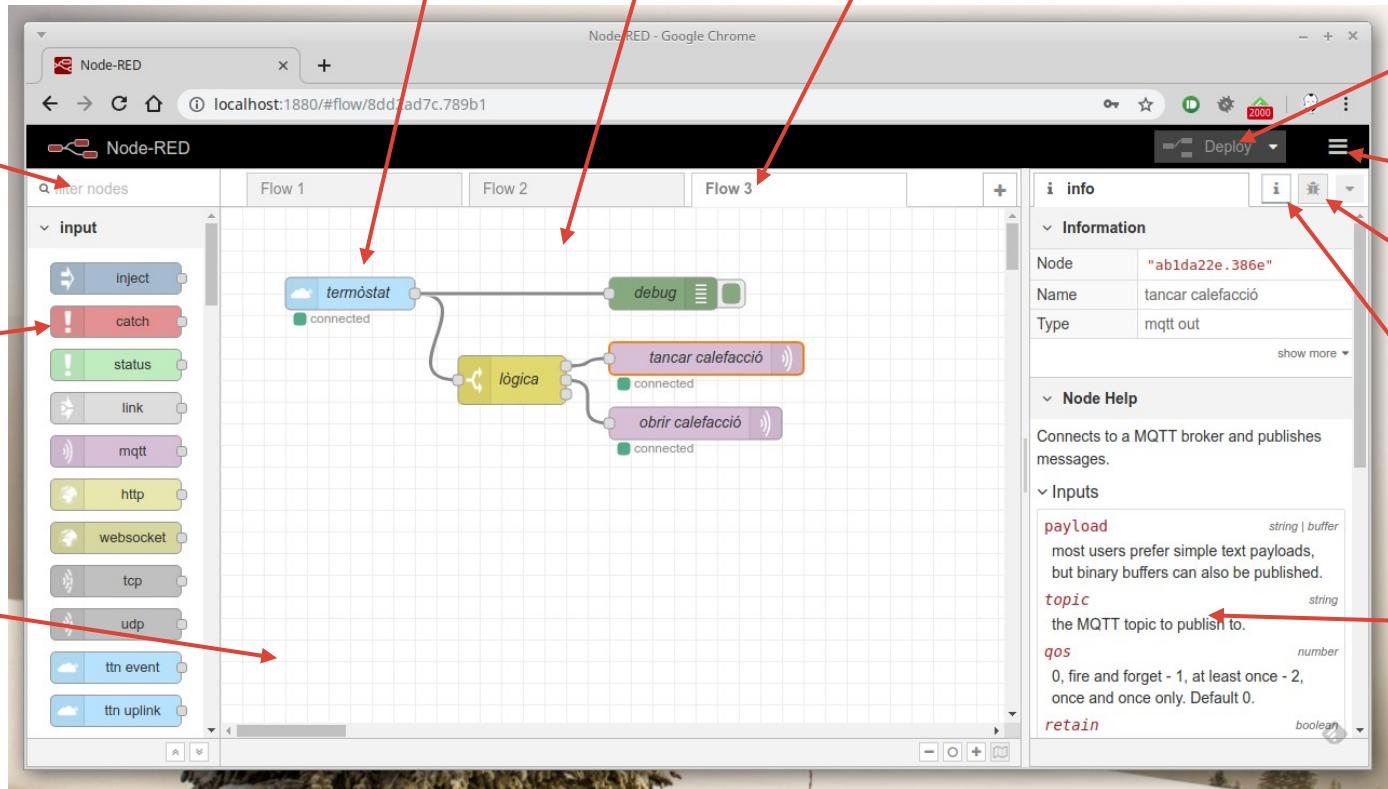

Biblioteca de nodes

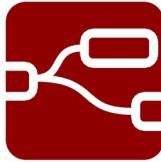

Espai de treball

Node

Fluxe

Selector d'espai de treball

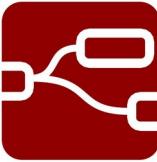

Node-RED - Missatges

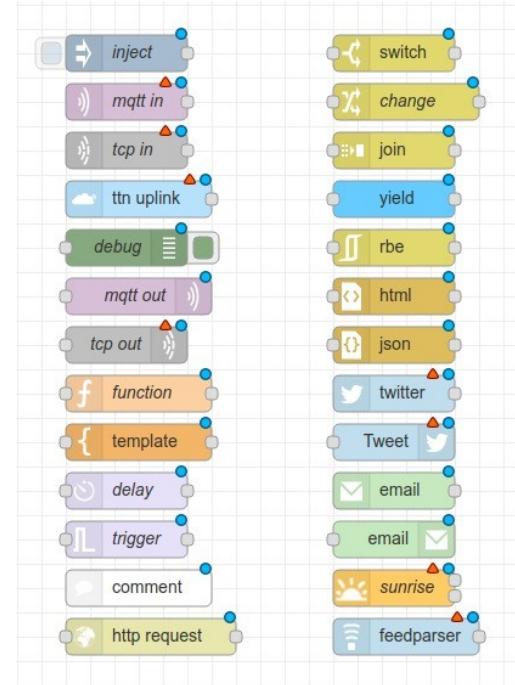

- objecte que es passa d'un node a un altre
- acostuma a estar en format **JSON**
- estructura i propietats arbitràries, però
- sovint presenta un **topic** i un **payload**
- de vegades conté informació de configuració pels nodes

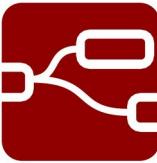

```
{  
  "topic":"/device/rfm69gw/rssi",  
  "payload":-36,  
  "qos":0,  
  "retain":false,  
  "_msgid":6336dfbc.26b45"  
}
```

Node-RED - Nodes

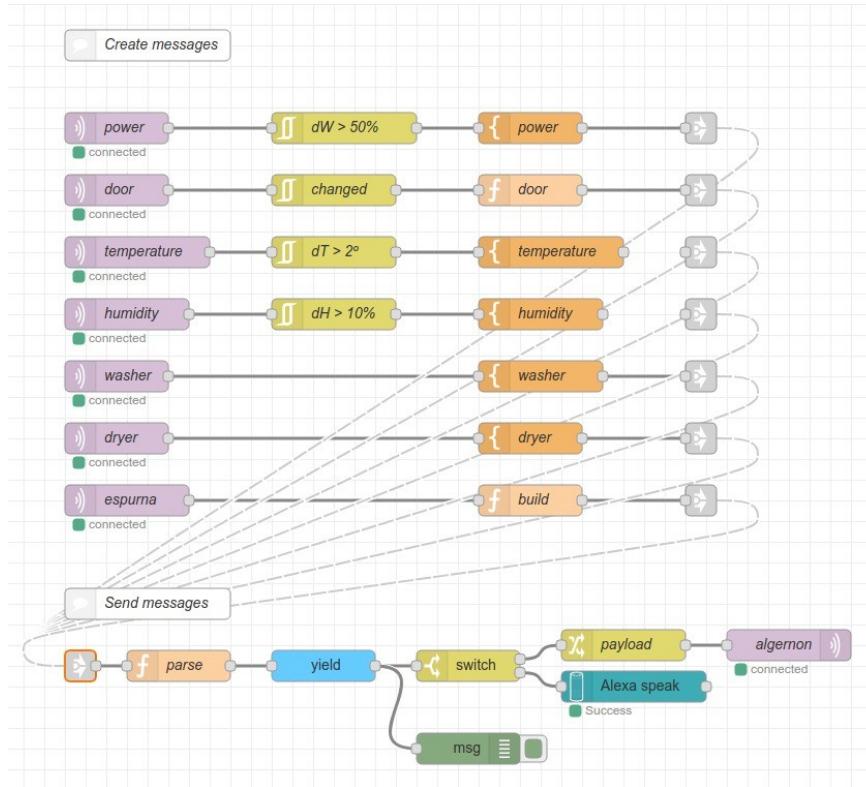

- rep un missatge i el processa
- una o cap entrada
- cap, una o més sortides
- pot descartar el missatge
- fa una única cosa
- es pot preconfigurar o
- pot agafar la configuració del missatge
- biblioteca de nodes precarregada
- milers d'extensions amb desenes de milers de nodes
(<https://flows.nodered.org>)

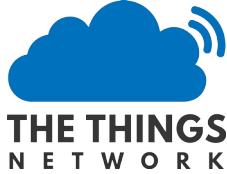

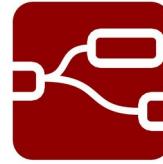

Node-RED - Fluxe

- conjunt de nodes connectats
- pot tenir múltiples ramificacions
- es pot dividir en diferents espais de treball amb nodes tipus “link”
- compta amb els bucles!

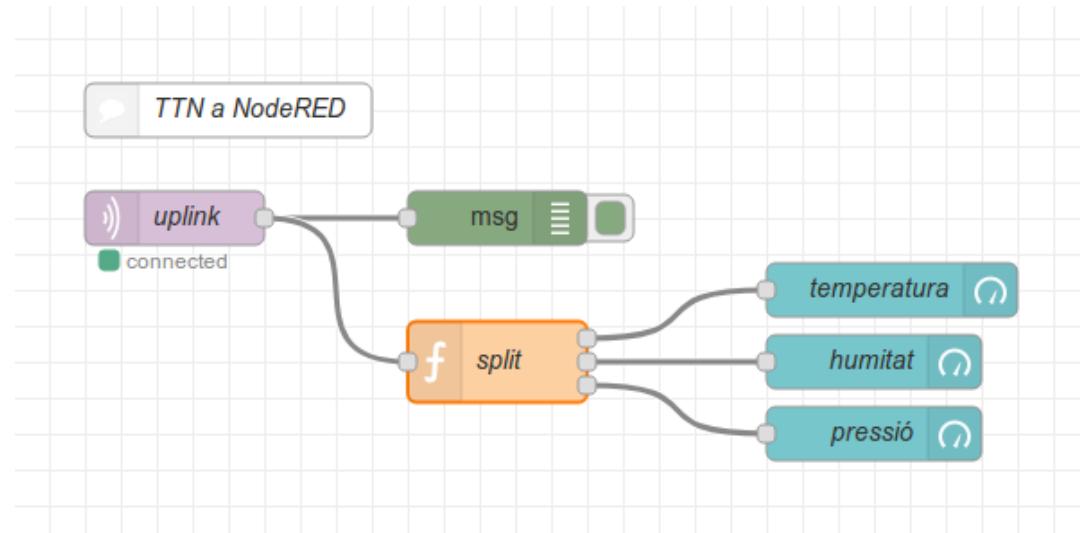

TTN - Node-RED

<http://<ip>:1880>

- El node MQTT rep el missatge de TTN i el node JSON converteix el payload de string a json.
- El podem veure amb el node “debug”
- “Split” en un node “function” que separa el payload en valors discrets
- I es passen individualment a nodes tipus “chart”

split

Function

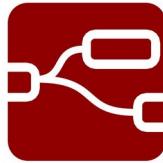

```
1 var out = [];
2 out.push({"payload": parseFloat(msg.payload.temperature)});
3 out.push({"payload": parseFloat(msg.payload.pressure)});
4 out.push({"payload": parseFloat(msg.payload.humidity)});
5 return out;
```

Outputs

3

See the Info tab for help writing functions.

The 'Edit function node' dialog box is open, showing the configuration for the 'split' node. It includes fields for 'Name' (set to 'split'), a code editor for the 'Function' (containing JavaScript code to split the payload into three outputs), and a dropdown for 'Outputs' (set to 3). A red circle highlights the 'Outputs' dropdown. A yellow bar at the bottom provides a link to the 'Info' tab for help writing functions.

Database Access

Setting the database for this datasource does not deny access to other databases. The InfluxDB query syntax allows switching the database in the query.
For example: SHOW MEASUREMENTS ON _internal OR SELECT * FROM "_internal", "database" LIMIT 10

To support data isolation and security, make sure appropriate permissions are configured in InfluxDB.

Min time interval: 10s

Telegram Bot (@botfather)

 **Xose** 11:50:32 PM
/newbot

 **BotFather** 11:50:32 PM
Alright, a new bot. How are we going to call it? Please choose a name for your bot.

 **Xose** 11:50:46 PM
taller-ttncat

 **BotFather** 11:50:46 PM
Good. Now let's choose a username for your bot. It must end in `bot`. Like this, for example: TetrisBot or tetris_bot.

 **Xose** 11:51:00 PM
taller_ttncat_bot

 **BotFather** 11:51:00 PM
Done! Congratulations on your new bot. You will find it at t.me/taller_ttncat_bot. You can now add a description, about section and profile picture for your bot, see [/help](#) for a list of commands. By the way, when you've finished creating your cool bot, ping our Bot Support if you want a better username for it. Just make sure the bot is fully operational before you do this.

Use this token to access the HTTP API:

Keep your token **secure** and **store it safely**, it can be used by anyone to control your bot.

For a description of the Bot API, see this page:
<https://core.telegram.org/bots/api>
